Why choose Meraki?

Visibility	All Meraki devices are cloud managed by our support team. With application layer visibility and verbose logging, we are able to quickly troubleshoot and diagnose many networking issues that could adversely affect your system's performance.
Performance	Low-end Routers are adequate for home use, but should never be used in an environment where your data requires a higher level of security. Our Unified Threat Management device has the security and throughput to protect your data while still providing a high level of performance to your connected devices.
Prevention	With content filtering on the MX security appliance, you can prevent your employees from using your POS devices improperly for web surfing and/or downloading malicious software or games.
Cost Savings	With a Meraki security appliance, most viruses and malware can be stopped before it ever enters your network, saving you thousands of dollars in software and hardware restoration.
Peace of Mind	As a merchant who accepts credit cards, the Payment Card Industry (PCI) has mandated Payment Application Data Security Standards (PA-DSS) requirements to you, to prevent credit card data breaches.
